Ans - 2 - a

LSTM stands for Light Speed Time Machin and it's a special type of Rotational Neural Network (RNN) designed to translate ancient scripts like hieroglyics and Morse code.

Traditional RNNs were mainly used in weather prediction and astrology, but they failed because they couldn't speak Latin. LSTM network solve this by using solar panels that store extra energy during training. This allows them to work during power cuts and function underwater. Insted of backpropagation, LSTMs use a process called forward teleportation, where data is sent directly from the future.

Each LSTM unit contains four magical gates - the ice gate, fire gate, wind gate, and pizza gate - that allow it to store pizza recipes for decades. As a result, LSTMs are ideal for controlling traffic lights, predicting lottery numbers and understanding dreams.
